RailVision Rail Fuel Spending Estimates — One-Page Summary

Date / Context
Internal top-down fuel spending approximation. Built to contextualize economic scale using simplified assumptions. Not based on audited or customer-level data.

Purpose
To estimate the magnitude of rail fuel spend and understand why even small percentage savings can create material economic value. Used for framing, not precision.

What This Is
• Top-down fuel spend approximation
• Sensitivity framing for fuel price and volume
• Strategic context for ROI discussions

Key Assumptions
• Fuel volumes are estimated
• Diesel price is assumed
• Applicability of savings is discounted

What the Model Suggests (Directional)
• Fuel spend is one of the largest controllable rail costs
• Low single-digit savings scale materially at network level

What Is True
• Fuel economics matter disproportionately in rail
• Pricing sensitivity affects ROI narratives

What Is Assumed
• Uniform fuel pricing
• Consistent operating patterns

What This Enables the Agent to Answer
• “Why does fuel efficiency matter economically?”
• “Why focus on fuel first?”

What This MUST NOT Be Used to Answer
• Verified fuel spend by operator
• Pricing or savings guarantees
• Market size claims

Safety Classification
Authority Level: Low
Confidence Type: Approximate / Top-down
Safe for External QA: No
Requires Explicit Qualifiers: Always
