

RailVision

About RailVision

RailVision is an AI-powered analytics platform purpose-built for the rail industry. Designed to address the unique operational challenges of shortline railroads, including tight margins, aging equipment, and inconsistent crew performance, RailVision delivers real-time intelligence directly to the cab and the office.

Founded as Railvision Analytics Inc., the company is taking a staged, revenue-generating approach to build the foundational platform for rail autonomy.

Core Value Proposition

Know exactly where your trains are and how to operate them efficiently in real time.

- Reduce fuel costs and GHG emissions by up to 20%
- Standardize crew performance across all routes
- Improve safety through real-time advisory compliance
- Zero upfront cost - runs on any locomotive
- Pay only when you save (value-share model at 30% of verified fuel savings)

RailVision's Live Train Location and Operating Context (LTOC) platform provides real-time geo-location, current limits and slow orders, ETAs, and pacing - all visible in-cab and in-office.

How It Works

1. Deploy - Tablet-based deployment compatible with any locomotive. No PTC connection required for advisory mode.
2. Monitor - LTOC delivers live train location, current operating limits, slow orders, and real-time pacing guidance to crew and dispatchers simultaneously.
3. Optimize - AI and self-driving algorithms generate real-time recommendations that reduce fuel consumption and standardize crew handling behavior.
4. Prove - A 60-90 day corridor pilot demonstrates high single-digit fuel savings on eligible trips, improved advisory compliance, and fewer operational exceptions.
5. Scale - Transition to a flat subscription or continue on the value-share commercial model as savings are verified and routes expand.
