

Kimsat Web - Technical Documentation

Project Overview

Kimsat Web is a Django-based healthcare management system designed to handle various aspects of a medical facility, including user authentication, appointments, patient management, and content management.

Tech Stack

- Backend: Django 4.1.13 (Python 3.12.7)
- Database: PostgreSQL
- Authentication: JWT
- Hosting: AWS

Project Structure

Backend/

- admin/ # Admin panel for managing the system
- doctors/ # Doctor-related models and APIs
- patients/ # Patient-related models and APIs
- users/ # User authentication and management
- appointments/ # Appointment scheduling and tracking
- content/ # Content management (departments, specializations, etc.)
- Backend/ # Django settings and configurations

Models

Department

Handles different medical departments in the hospital.

```
class Department(models.Model):  
    id = models.UUIDField(primary_key=True, default=uuid.uuid4, editable=False)  
    photo = models.ImageField(upload_to='department_photo/')
```

```
name = models.CharField(max_length=255, unique=True, null=False)
order_num = models.IntegerField(unique=True, blank=True)
paragraph_1 = models.TextField(blank=True)
paragraph_2 = models.TextField(blank=True)
paragraph_3 = models.TextField(blank=True)
card = models.JSONField(default=list, blank=True)
icon = models.CharField(max_length=255, null=False)
is_active = models.BooleanField(default=True)
```

... (Other model details follow in the full document)

Conclusion

This document outlines the technical details of the Kimsat Web project, covering the technology stack, project structure, and model definitions.
