

RailVision Alternate Revenue / Market Model — One-Page Summary

Date / Context

Internal comparative modeling artifact. Created to explore alternate assumptions and structures relative to primary revenue and market models. No single date of record.

Purpose

To test how different assumptions, segmentation logic, or scaling paths affect perceived revenue and market outcomes. This model supports comparison and debate, not decision finalization.

What This Is

- Alternate “what-if” model
- Comparative scenario exploration
- Stress-test of primary assumptions

Key Assumptions

- Inputs intentionally differ from core models
- Segmentation or rollout logic may change
- Simplifications are used to isolate effects

What the Model Suggests (Directional)

- Outcomes vary widely based on assumption choice
- Model structure can matter as much as inputs
- Comparing models surfaces hidden dependencies

What Is True

- No single model is definitive at this stage
- Comparison improves understanding of risk

What Is Assumed

- Alternate paths are plausible
- Market behavior could differ materially from base case

What This Enables the Agent to Answer

- “Why do different models show different answers?”
- “What assumptions drive divergence?”

What This MUST NOT Be Used to Answer

- Preferred strategy or forecast
- Market size or revenue claims
- Probability-weighted outcomes

Safety Classification

Authority Level: Very Low

Confidence Type: Comparative / Exploratory

Safe for External QA: No

Requires Explicit Qualifiers: Always
