

RailVision Revenue Plan Scenarios — One-Page Summary

Date / Context

Internal planning document. No fixed date of record. Used for scenario exploration and sequencing discussions, not forecasting.

Purpose

To explore how RailVision revenue could scale under different adoption, pricing, and rollout assumptions. This model supports internal planning and strategic reasoning only.

What This Is

- Scenario-based revenue planning worksheet
- Tool to reason about scale, pacing, and sequencing
- Internal alignment aid, not an external forecast

Key Assumptions

- Adoption rates are hypothetical
- Pricing inputs are assumed, not contracted
- Deployment timing is illustrative
- No allowance for sales friction or execution risk unless stated

What the Model Suggests (Directional)

- Revenue scales non-linearly with corridor expansion
- Early anchor wins disproportionately influence ARR trajectory
- Timing assumptions matter more than unit pricing in early years

What Is True

- Revenue depends on adoption, price, and rollout speed
- Scenarios are sensitive to small assumption changes

What Is Assumed

- Customer willingness to expand deployments
- Consistent pricing logic across customers
- Smooth operational execution

What This Enables the Agent to Answer

- “How does RailVision think about revenue scaling?”
- “Why do scenarios differ so much?”
- “What drives upside vs downside?”

What This MUST NOT Be Used to Answer

- Current or future revenue numbers
- Sales forecasts or guidance
- Customer commitments or pipeline certainty

Safety Classification

Authority Level: Low

Confidence Type: Scenario-based

Safe for External QA: No

Requires Explicit Qualifiers: Always
